

CyberArk Defender IAM Certification

Study Guide

Exam Objectives

The CyberArk Defender - IAM Certification tests for the practical knowledge and technical skills to maintain day-to-day operations and to support the on-going maintenance of the CyberArk's IAM solutions.

Exam Content

The CyberArk Access Certification tests examanees ability to perform the following tasks in seven knowledge domains.

CyberArk Identity Setup

- Describe the CyberArk Identity workflow.
- Configure email delivery and add users.
- Identify and describe user types and provisioning methods.
- Identify and describe the process for adding users including CyberArk Cloud Directory users and users from an external directory service.
- Set up federation with external identity providers.
- Identify and describe prerequisites and potential use cases.
- Provision specific users to the CyberArk Cloud Directory with SCIM, such as Microsoft Entra ID and Okta users.
- Configure MFA.
- Identify and describe MFA basics and steps to configure MFA for all users and service users.
- Identify and describe authentication mechanisms, i.e., something you have, something you know, something you are.
- Assign and manage user roles.
- Identify and describe prerequisites.
- Add users to existing roles.
- Remove users from a role.
- Assign domain users/groups to the System Administrator role.
- Invite users.

Tenant Setting Configuration

- Manage login suffixes and social login users.
- Perform various customization tasks, e.g., portal and login windows, email and SMS message content, access to User Portal pages, support links.
- Configure custom SMTP and SMS server settings and idle session timeout.

Identity Administration

- Install and manage the CyberArk Identity Connector.
- Identify and describe requirements and installation steps.
- Install additional connectors.
- Describe steps to improve connector performance including load balancing guidelines.
- Perform configuration tasks, e.g., change settings, disable and uninstall.
- Configure authentication, e.g., users in multiple domains, trusted domains, independent domains in multiple forests.
- Identify and describe permission requirements.
- Troubleshoot the connector.
- Manage users.
- Perform management tasks, e.g., user object management, migrate users and passwords from external directories/applications to the CyberArk Cloud directory, add custom user attributes, set user password and email verification policies, protect users' personally identifiable information, delete user accounts.
- Perform configuration tasks, e.g., user self-service options, user application login settings.
- Describe how to search for users and update their account information.
- Troubleshoot common issues with user accounts.
- Perform tasks associated with roles, e.g., assign users to roles, assign administrative rights to a role, delete roles.
- Manage policy sets, e.g., create a policy set and assign it to users, apply hierarchical policy sets, hide folders in the User Portal, set the User Portal Landing page.
- Manage certificates for different authentication types.

MFA Configuration

- Describe MFA concepts, requirements, and authentication compliance.
- Manage adaptive MFA.
- Describe the use of Access Orchestration.
- Create custom authentication using Access Orchestrator.
- Identify and describe authentication security options.
- Perform various MFA configurations, e.g., User Portal, Identity Administration Portal, Mobile Authenticator MFA redirect for users, apply MFA to VPN and VDI connections, MFA for certificate-based authentication, MFA for third-party integration.
- Enable various security options, e.g., helpdesk caller identification, CAPTCHA, OATH OTP, FIDO2 authentication, YubiKey OTP, Passkeys, bypass user portal authentication for launching applications.
- Perform additional MFA tasks, e.g., remember last used authentication method, manage Integrated Windows Authentications (IWA), configure browsers for silent authentication, configure local account linking, define secure zones, block IP addresses, temporarily suspend MFA, set up smart card authentication.

Identity Management

- Manage Identity lifecycles using Lifecycle Management (LCM).
- Integrate external Identity providers.
- Provision users to external apps (outbound).
- Describe the use of the CyberArk Identity Browser extension and how to deploy and configure it.
- Create and manage organizations.
- Create delegated admin roles.
- Manage security, reports, widgets, and sets.
- Analyze User Behavior using UBA (User Behavior Analysis).

Workforce Password Management (WPM) Implementation and Management

- Configure WPM sharing and sharing email notification.
- Describe and implement WPM transfer of ownership.
- Configure and use OTP (one-time password).

© Cyber-Ark Software Ltd. | cyberark.com

- Import credentials to WPM (migrations).
- Use the WPM password/passphrase generator.
- Block passwords and domains.
- Use WPM secured items.
- Describe different methods to save passwords.
- Organize objects in the user portal, e.g., folders, tags, filters, tabs.

Session Security

- Integrate Secure Browser with Identity tenant.
- Configure an app to use Secure Browser.
- Integrate SWS (Secure Web Sessions) with Identity tenant.
- Describe the use of SWS step recording.
- Describe how to configure SWS continuous authentication.
- Describe and implement SWS session protection.
- Describe and implement SWS session control.
- Integrate SWS with web application via Identity as IDP.
- Integrate SWS with web application via Authentication Router.
- Install CyberArk Authenticator app for SWS.
